Q01 Deeper Project Ideas

1. **Controlled generalization benchmark.** Create a synthetic grammar with held-out rule combinations; compare a frequency baseline, a small sequence model, and a retrieval baseline. Report accuracy, calibration, and failures.

2. **Prompt-as-data experiment.** Hold a task fixed while varying the number, order, and quality of demonstrations. Pre-register the metric and test whether gains transfer to paraphrased prompts.

3. **Metric sensitivity audit.** Replot a scaling result under continuous and thresholded metrics. Explain which conclusions survive and which depend on the metric.
