Q02 Discussion Questions

1. Which operational abilities should count most in a definition of intelligence, and why?
2. Could a system pass many task tests while lacking properties you regard as central to intelligence?
3. What distribution shift would be most revealing for an apparent reasoning capability?
4. When does a thresholded benchmark score mislead us about a smooth underlying change?
5. What evidence, if any, could bear on claims about machine consciousness rather than task competence?
