Q05: Project Suggestions

DLS 2026 — Kukla

October 2026

1. **Coverage curves (small, 2–3 days).** On a verifiable benchmark (e.g. GSM8K), measure accuracy vs. n for best-of-n with and without a verifier; fit the diminishing-returns curve and locate the cost-optimal n.

2. **Overthinking study (medium, 3–5 days).** Sweep forced reasoning length on an easy and a hard task set; show the inverted-U and identify where extra length starts to hurt.

3. **Adaptive compute (larger, 1–2 weeks).** Build a difficulty estimator that allocates more samples/longer traces only to hard queries; compare total compute vs. fixed-budget baselines at matched accuracy.
