Q07: Project Suggestions

DLS 2026 — Kukla

October 2026

1. **Fit your own scaling law (medium, 3–5 days).** Train a small model family at several sizes on a fixed corpus; fit loss vs. parameters to a power law and test whether it extrapolates to a held-out larger size.

2. **Chinchilla check (medium, 1 week).** At a fixed compute budget, sweep the N vs. D split and empirically locate the compute-optimal point; compare to the Chinchilla prediction.

3. **Data-wall estimate (small, 2–3 days).** Using public estimates of high-quality text stock and a chosen scaling recipe, compute when a target model size runs out of compute-optimal tokens; write up the sensitivity to assumptions.
