Q10: Project Suggestions

DLS 2026 — Kukla

October 2026

1. **Map a jagged frontier (medium, 4–6 days).** Build a battery of matched easy/hard task pairs; measure a model across them and visualize where competence is non-monotonic in human-perceived difficulty.

2. **Tokenization repair (small, 2–3 days).** Take a character-counting or arithmetic failure; show it is fixed by reframing the input (spelled-out letters, digit separators) without changing the model.

3. **Tool-augmentation study (medium, 1 week).** Compare a model alone vs. the same model with a calculator/code tool on an arithmetic suite; quantify how much of the "simple mistake" gap is closed by the harness.
