Q15: Comprehension Check

DLS 2026 — Kukla

October 2026

Comprehension check. A team wants their assistant to answer questions over a 10-million-token internal wiki that updates daily. They propose training the facts into the model's weights. Give the main drawback of that approach and the standard alternative, and state one reason the alternative also reduces hallucination.

Answer. Baking a daily-updating 10M-token corpus into weights is impractical: it far exceeds any context window to train on at once, and the facts go stale immediately—every daily update would require retraining/fine-tuning. The standard alternative is **retrieval-augmented generation**: index the wiki as vectors and retrieve the relevant chunks per query into the context, so updates are just re-indexing (no retraining) and the corpus can be arbitrarily large. It also reduces hallucination because the answer is *grounded* in the retrieved passages and can cite them, rather than relying on the model's parametric guess.
