## Understanding check

**Question.** A team reports 94% benchmark accuracy for a chatbot. Name two additional artifacts needed before approving deployment and explain what each can reveal.

**Expected answer.** Any two of: representative error analysis/stress suite, data provenance and split documentation, tool-enabled end-to-end test, threat model/permissions review, monitoring and rollback plan. Each must connect an artifact to a failure boundary.

**Misconception diagnosed.** "A high benchmark score proves the product is ready."
